Write a letter equation for two steps

I can… represent and solve a two-step story with an unknown.

There are 96 crayons. Four tables share them equally. Each table uses 5 crayons. How many crayons remain at each table?

$c = (96 \div 4) - 5$

$96 \div 4 = 24$

$c = 24 - 5 = 19$ crayons

$19 + 5 = 24$; $4 \times 24 = 96$

The answer is per table, so do not subtract 5 from 96 first.
