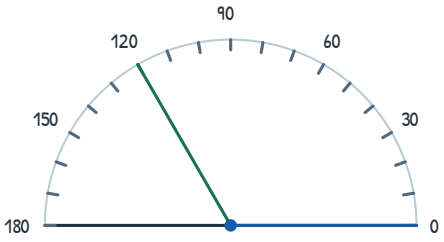
Use the protractor scale that begins at zero

I can... align a protractor and measure an angle.



Start at 0 on the first ray.

1. Put the center on the vertex.
2. Put the zero line along the first ray.
3. Read the scale that starts at that zero.

The angle measures 120°.

The opening is wider than a right angle, so 120° fits. 60° would be acute.
