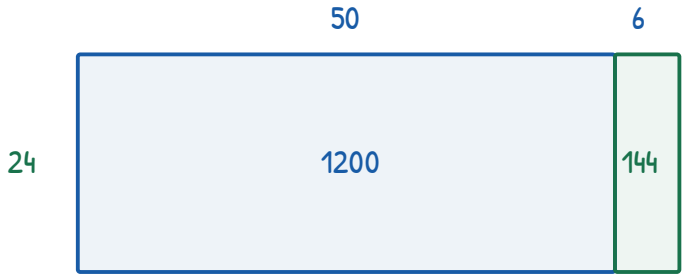
An area model connects multiplication and division

I can... find a quotient by decomposing a dividend.

Find 1,344 ÷ 24. A rectangle has height 24 and area 1,344.



24 × 50 = 1,200; 24 × 6 = 144

1,344 ÷ 24 = 50 + 6 = 56

24 × 56 = 1,344

Each partial quotient is a part of the missing width.
