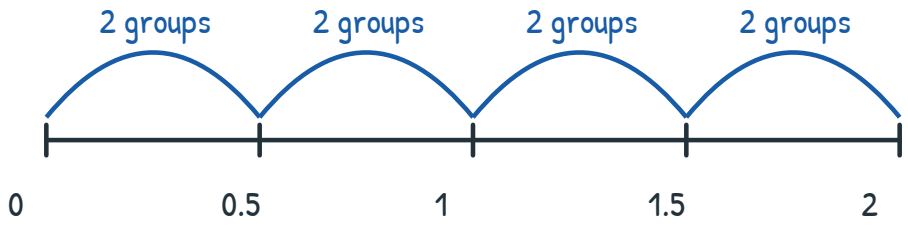
Repeated subtraction explains decimal division

I can… count decimal-size groups in a whole number.

How many 0.25-liter servings are in 2 liters?



Each 0.5-liter jump contains two 0.25-liter servings.

$2 \div 0.25 = 8$ servings

$8 \times 0.25 = 2$ liters

Division counts the groups; the group size is one fourth of a liter.
