Addition algorithm: line up the places

I can… use place value to explain the standard addition algorithm.

$$\begin{array}{r} {\scriptstyle 1\ \ 1\ \ 1\ \ 1\ \ \ } \\ 4\ 7\ 8\ 6\ 5 \\ +\ 2\ 6\ 5\ 7\ 8 \\ \hline 7\ 4\ 4\ 4\ 3 \end{array}$$

3 ones remain after exchanging 13 ones for 1 ten and 3 ones.
14 tens → 1 hundred and 4 tens.
14 hundreds → 1 thousand and 4 hundreds.
14 thousands → 1 ten-thousand and 4 thousands.

47,865 + 26,578 = 74,443

Each small green 1 is one unit of its new place, not always one single object.
