How we explain and discuss math

I can… explain my thinking and respond to another mathematician.

Show a reason

$6 \times 7 = (5 \times 7) + (1 \times 7) = 35 + 7 = 42$

"I broke 6 groups into 5 groups and 1 more group."

Connect to someone's idea

"I agree because your two parts still make 6 groups."
"Where do I see the extra group in your model?"

Disagree with a reason

$6 \times 7 \neq 35 + 1$

"One more group of 7 adds 7, not 1."
