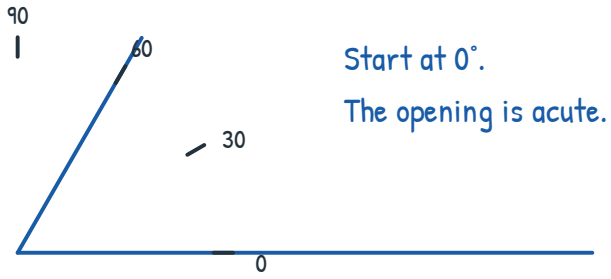
Measure, draw, and find missing angles

I can… measure and draw angles and find an unknown angle using addition or subtraction.

Use a protractor carefully

1. Put its center on the vertex.
2. Align the zero line with one ray.
3. Start at 0 on that ray's scale.
4. Read where the other ray crosses.

Measure and sketch 60°



Start at 0°.

The opening is acute.

An angle is made of parts

$35^\circ + x = 90^\circ \rightarrow x = 55^\circ$
