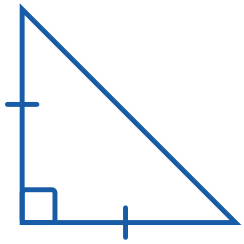
Classify triangles and quadrilaterals

I can… classify shapes using side lengths, angles, and line relationships.

Triangles have two descriptions

Sides: equilateral, isosceles, or scalene.
Angles: acute, right, or obtuse.
A triangle may be both isosceles and right.



2 equal sides

1 right angle

Quadrilateral categories overlap

A parallelogram has two pairs of parallel sides.
A rectangle has four right angles.
A rhombus has four equal sides.
A square has both!

Explain a square's memberships

Square → rectangle AND rhombus → parallelogram
