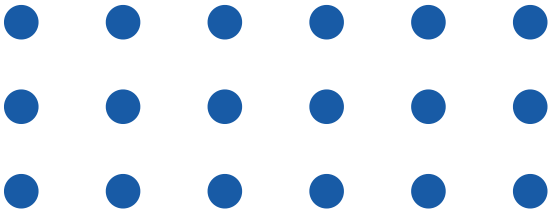
Arrays show multiplication

I can... use rows and columns to represent multiplication.

Three rows of 6



3 rows

6 in each

$3 \times 6 = 18$

Turn the array

Rotate it: now there are 6 rows with 3 in each. The number of objects stays 18.

$6 \times 3 = 18$

Explain the property

$3 \times 6 = 6 \times 3$

Changing the order of factors does not change the product.
