Zero, one, and unknown numbers

I can... explain zero and one facts and solve equations with a missing number.

Zero groups and one group

$0 \times 8 = 0 \cdot 1 \times 8 = 8$

Zero equal groups contain no objects. One group contains exactly its group size.

An unknown can be anywhere

$? \times 6 = 30 \rightarrow ? = 5$

$30 = 6 \times ? \rightarrow ? = 5$

$30 \div ? = 6 \rightarrow ? = 5$

Equality means the same value

Both sides of the equal sign must represent the same amount.
