Each place is ten times as much

I can… explain how a digit's value changes in adjacent places.

Same digit, different values

Number	Value of 4
4,400: first 4	4,000
4,400: second 4	400

4,000 = 10 × 400

Explain the relationship

4 thousands = 40 hundreds.
One thousand is 10 hundreds. The 4 in the thousands place has 10 times the value of the 4 in the hundreds place.

Try another pair

700 = 10 × 70

Compare values, not just the names of the places.
