Place value extends into decimals

I can… explain ten-times and one-tenth relationships between adjacent places.

Same digit in three places

Digit position	Value in 55.5
Tens	50
Ones	5
Tenths	0.5

Compare adjacent values

$50 = 10 \times 5 \cdot 5 = 10 \times 0.5$

$5 = 1/10 \times 50$

Name the relationship

Moving one place right makes a digit's value one tenth as much. Moving one place left makes its value ten times as much.
