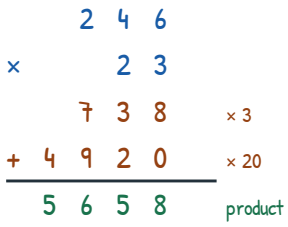
Multiply with the standard algorithm

I can... fluently multiply a three-digit number by a two-digit number and explain the steps.

246 × 23

Multiplier part	Partial product
3 ones × 246	738
2 tens × 246	4,920
Total	5,658

Record the standard algorithm



246 × 23 = 5,658

Check reasonableness

250 × 20 = 5,000

The exact answer is a little greater, as expected.
