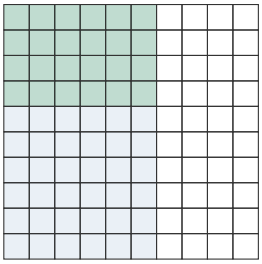
Multiply decimals with unit reasoning

I can… use an area model to explain a decimal product.

0.6 by 0.4 of one whole



24 overlap parts out of 100

Count the overlap

6 tenths × 4 tenths = 24 hundredths

0.6 × 0.4 = 0.24

Check the size

Taking four tenths of six tenths gives less than six tenths. The product is smaller than either positive factor here.
